

Seam Construction

Serged Seam

Produced when threads are interlocked around the material edges for a strong, stress-resistant seam.

Bound Seam

Bound seams deliver extra durability and strength, as well as, reduce particulate shedding and provide extra protection against fluids.

Ultrasonically Welded Seam

There are no thread holes with this seam. The material is welded together creating a superior particle and fluid barrier.

Heat Sealed Seam

This strong, impervious seam is used when ultrasonic welding is incompatible with the garment material. Used in shoe cover production.

Safety Stitched Seam

An extra safety stitch is added above the serged seam to offer added strength, durability and protection. Used in scrubs production.

Tunneled Elastic

This design provides a secure closure for the garment and helps to limit particle and fluid contamination.
